Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

-!- FUNCTION: INIBIN IS A GONADAL GLYCOPEPTIDE THAT INHIBITS THE SECRETION OF FOLLITROPIN BY THE PITUTARY GLAND.
-!- SUBGNIT: DIMERIC, LINKED BY ONE OR MORE DISULFIDE BONDS.
INHIBIN A IS A DIMER OF ALPHA AND BETA-A.
INHIBIN B IS A DIMER OF ALPHA AND BETA-B.
-!- SIMILARITY: BELONGS TO THE TGF-BETA FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          0;

elevention: Inhibit is A GONADAL GLYCOPEPTIDE THAT INHIBITS THE SECRETION OF FOLLITROPIN BY THE PITUITARY GLAND.

elevention: SECRETION OF FOLLITRED BY ONE OR MORE DISULFIDE BONDS.

INHIBIN A IS A DIMER OF ALPHA AND BETA-A.

INHIBIN B IS A DIMER OF ALPHA AND BETA-B.

elevention: Inhibit is BELONGS TO THE TGF-BETA FAMILY.

elevention: It is produced through a colling the second colling is a produced through a colling is a colling in the second colling in the second colling is a colling in the second colling is a colling in the second colling is a colling in the second colling in the second colling is a colling in the second colling in the second colling is a colling in the second colling in the second colling is a colling in the second colling in the second colling is a colling in the second colling is a colling in the second colling in t

A Ying S.Y., Ueno N., Ling N.;

"Complementary deoxyribonucleic acid (cDNA) cloning and DNA sequence
analysis of rat ovarian inhibins.";

Mol. Endocrinol. 1:388-396(1987).

C. 1- FUNCTION: INHIBIN IS A GONADAL GLYCOPEPTIDE THAT INHIBITS 1..

SECRETION OF FOLLITROPIN BY THE PITUITARY GLAND. ON THE OTHIN. ACTIVATES THE SECRETION OF FOLLITROPIN.

C. 1- SUBUNIT: DIMERIC, LINKED BY ONE OR MORE DISULFIDE BONDS.

INHIBIN A DIMER OF ALPHA AND BETA-A.

INHIBIN B IS A DIMER OF ALPHA AND BETA-B.

C. 1- TISSUE SPECIFICITY: ALPHA- AND BETA-B.

PREDOMINANT FORMS FOUND IN RAT TESTIS.

C. 1- SIMILARITY: BELONGS TO THE TGF-BETA FAMILX.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Rattus norvegicus (Rat).

-! FUNCTION: INHIBIN IS A GONADAL GLYCOPEPTIDE THAT INHIBITS THE SECRETION OF FOLLITROPIN BY THE PITUITARY GLAND. ON THE OTHER HAND ACTIVIN ACTIVATES THE SECRETION OF FOLLITROPIN.

-!- SUBUNIT: DIMERIC, LINKED BY ONE OR MORE DISULFIDE BONDS.

INHIBIN A IS A DIMER OF ALPHA AND BETA-B.

-!- SIMILARITY: BELONGS TO THE TGF-BETA FAMILY.

                                                                                                                                                                                                                                                                                                                                                                                                                                            Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 1, A Sequence 2, A Sequence 4, A Sequence 5, A Sequence 5, A

Sequence 12, Application US/08168390
Patent No. 5620955
GENERAL INFORMATION:
APPLICANT: Knight, Martha
APPLICANT: Takahashi, Kazayuki
APPLICANT: Takahashi, Kazayuki
APPLICANT: Chandrasekhar, Bhaskar
TITLE OF INVENTION: Bombesin/Gastrin Releasing Peptide Antayonists
NUMBER OF SEQUENCES: 16
CORRESPONDENCE ADDRESS:
ADDRESSEE: Sterne, Kessler, Goldstein & Fox
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ÇĒ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /note= "The amino-terminal residue comprises one of several chemical end

The peptides were tested in a competitive binding assay and a Phosphatidyl Inositol (PI)-turnover assay in mouse pancreas. None of the peptides demonstrated agonist activity but all inhibited PI-turnover (c.f. stimulation produced by 100M GRP). Analogues of bombesin are potentially useful for growth therapy and the treatment of digestive disorders, e.g. for stimulating digestion, stimulating growth of tissue in the lung, pancreas and intestine, stimulating my court activity against tumour cells and stimulating qrowth of tumours to increase susceptibility to chemotherapeutic agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            /label= OTHER

The peptide may be preceded by a formyl, acetyl, propionyl, acrylyl or benzoyl group at its C-terminal. The peptide may be used for reducing the body temp. of a mammal, as well as for inducing analgesia. It produces hypothermia when injected i.c., but not when given i.v. or s.c. See also AAP20291-3.

The peptide may be used as an antimitotic and antisecretory peptide. It can control growth of small cell lung and prostatic carcinomas, and it can also inhibit gastric secretions which are causative and symptomatic of peptic ulcers. Administration may be oral but is preferably subcutaneous, intravenous, intranscular or intraperitoneal, by depot injection, by implant preparation or by application to the mucous membranes (e.g. of the nose or bronchial

These peptides are specifically claimed examples of a generic formula. The C-terminal amino acid (Met) of the naturally occurring peptide has been converted to a methylester. The peptide is useful for treating benign or malignant tissue proliferation, artherosclerosis, gastrointestinal disorders and diabetes. They act as competitive inhibitors of natural peptides, since they bind to the cell receptors but have no biological
                                                                                                                                                                                                                                                                                                                                                                     New linear peptide analogues of bombesin - modified to eliminate biological activity while retaining receptor affinity, for treating cancer, diabetes, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The analogue may also be of a naturally occurring peptide terminating at the C-terminus with a Met residue, such as the 10 amino acid C-terminal region of mammalian GRP or amphibian
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Score 36; DB 12; Length 8;

The C-terminal amino acid (Met) of the naturally occurring peptide has been converted to an amide and Phe 8 has been replaced by beta-Leu. Gy 6 has also been replaced by D-Ala. The peptide is useful for treating benign or malignant tissue proliferation, artherosclerosis, gastrointestinal disorders and diabetes. They act as competitive inhibitors of natural peptides, since they bind to the cell receptors but have no biological
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

                                                                                                                                                                                                                                                                                                       Example of peptide agonist of GRP, neuromedin, bombesin and litorin.
                               The inventors claim 36 peptides. Also claimed are: (a) pharmaceutical prepn. of a peptide of the invention; (b) prepn.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This is a peptide analogue of mammalian gastrin releasing peptide (GRP), neuromedin-B or -C, amphiblan bombesin and litorin.
It is an agonist of these cpds. and is used to treat smooth muscl. proliferation and cancer of the prostate, breast or lung.
Residue 6 (Ala) is D-alanine.

The C-terminal residue is amidated. This peptide is one of 27 specific examples of a highly generic formula. The peptides are all amalogues of either litorin; the 10 amino acid C-terminal region of mammalian GRP, neuromedin B or neuromedin C; or the 10 amino acid C-terminal region of amphibian bombesin. They act as at least partial agonists of the natural peptides. The peptide analogues are made by standard methods of synthesis and can be cyclised.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Peptide agonists of litorin, gastrin releasing peptide - neuromedin B or C or bombesin, for treating cancer, preventine smooth muscle proliferation and suppressing appetite and alcohor:

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The C-terminal residue is amidated. This peptide is one of 27 specific examples of a highly generic formula. The peptides are all analogues of either litorin; the 10 amino acid C-terminal region of mammalian GRP, neuromedin B or neuromedin C; or the 10 amino acid C-terminal region of amphibian bombesin. They act as at least partial agonists of the natural peptides. The peptide analogues are made by standard methods of synthesis and can be cyclised.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

The C-terminal residue is amidated. This peptide is one of 27 specific examples of a highly generic formula. The peptides are all analogues of either litorin; the 10 amino acid C-terminal region of mammalian GRP, neuromedin B or neuromedin C; or the 10 amino acid C-terminal region of amphibian bombesin. They act as at least partial agonists of the natural peptides. The peptide analogues are made by standard methods of synthesis and can be cyclised.
                                                                                                                                                                                                                                                                                                   Peptide agonists of litorin, gastrin releasing peptide -
neuromedin B or C or bombesin, for treating cancer, preventing
smooth muscle proliferation and suppressing appetite and alcohol
